

Assignment: Automate Postman Tests with GitHub Actions

Subject: Automate Postman API Tests for Phoenix Inwarranty Flow

Hi Team,

Great work on creating the Postman Collection and writing the test cases

However, I've noticed that the team is still running the Postman tests manually. It's time to take this to the next level and integrate it into our CI/CD workflow.

We need to **automate the execution of our Postman tests** using **GitHub Actions** for the *Phoenix Inwarranty Flow*.

Here's what I'd like you to accomplish:

- **Set Up GitHub Actions Workflow**

- Create a workflow `.yaml` file to run the Postman collection:
 - Schedule it to run daily at **8:00 AM IST** and **7:30 PM IST**.
 - Support manual trigger via `workflow_dispatch`.

- **Install Required Dependencies**

- Use `npm` to install:
 - `newman`
 - `newman-reporter-htmlextra`

- **Execute Tests**

- Run the tests using:
 - The appropriate Postman environment and test data files.
- Generate **detailed HTML reports** using the `htmlextra` reporter.

- **Upload/Archive Reports**

- Upload the generated HTML reports as workflow artifacts.
- Make them accessible directly from the GitHub Actions dashboard.

Why This Matters- (Remember it for Interview)

- ✓ It reduces manual testing efforts.
- ✓ We don't need to setup and manage Jenkins CI ourself.
- ✓ It ensures faster feedback for our API changes.
- ✓ It builds reliability and consistency in our development cycle.

This is a priority task. Please ensure the implementation is complete and tested by end of the week.
